FLUORESCENT HANGING LIGHT FIXTURE

2

3

SPH
0001 This application under 37 CFR 1.53 (b,2) is a continuation-in-part of ser. no. 09/870,976, filed 06/01/2001, for now U.S. Patent No. 6,585,396
FLUORESCENT HANGING LIGHT FIXTURE, having the same inventor.

4

5

6

7

BACKGROUND OF THE INVENTION

8

9

10

11

12

13

14

15

16

Fluorescent hanging light fixtures, up to the present have a shroud fastened to the ceiling, or are mounted in recessed openings in the ceiling, and the ballast is mounted in the concave side of the shroud. This present invention discloses a hangable fluorescent light fixture with elongated fluorescent light tubes, mounted on the concave side of elongated reflectors and the elongated reflectors attached to socket mount/wire raceway arms of the fluorescent light fixture frame.

17

18

SUMMARY OF THE INVENTION

19

20

21

22

23

24

25

26

27

28

29

Disclosure is made of a fluorescent light fixture 1, having elongated light reflectors 4, and each end of the light reflectors 4, attached to socket mount/wire raceway arms 6, attached to ends of ballast channel assembly 2, and sockets 5, for elongated fluorescent light tubes 3 mounted on socket mount/wire raceway arms 6 at each end of the elongated light reflectors 4 on the concave side, and elongated fluorescent light tubes 3, inserted into fluorescent light tube sockets 5 on the concave side 4'' of the elongated light reflectors 4, and the elongated light reflectors 4 having a parabolic shape in cross section, to control down light

30

31

0004 In the following specification and claims the terms

PAPER # 1

1
2 "light reflectors" and "fluorescent light tubes" includes
3 "elongated light reflectors" and "elongated fluorescent light
4 tubes", identified as linear fluorescent bi-pin tubes.
5 0005 An object of this invention of a fluorescent light
6 fixture assembly 1 including a fluorescent light fixture
7 frame 12 a ballast channel assembly 2 and socket mount/wire
8 raceway arms 6, attached to the ballast channel assembly 2
9 and fluorescent light reflectors 4, attached to the socket
10 mount/wire raceway arms 6, and fluorescent fixture tube
11 shunted sockets 5, 5' attached to the socket mount/wire raceway
12 arms 6, and the fluorescent fixture tube sockets 5, 5' located
13 under each end of the fluorescent light reflectors 4, and
14 fluorescent dual pin light tubes 3, inserted into the fluores-
15 cent fixture tube shunted sockets 5, 5' under the reflectors 4,
16 and an electric power source 7 into the light fixture assembly
17 and a switch on/off 20 mounted on the ballast channel
18 assembly, and the power connected to the ballast 23
19 components mounted in the ballast channel assembly 2.
20 0006 Another object is to disclose elongated fluorescent
21 light reflectors of new geometry and assembly to better reflect
22 elongated fluorescent tube light downward.
23 0007 Another object is to disclose a fluorescent light tube
24 assembly having a plurality of eight elongated fluorescent
25 light tubes aligned parallel side by side in an assembled
26 fluorescent light fixture, and an elongated reflector over each
27 of the elongated fluorescent tube lights, and only one ballast
28 for a total plurality of at least two to eight elongated fluo-
29 rescent light tubes in the light fixture.
30 0008- Another object of this invention is to disclose
31 rim edges, bent outwards, on edges of elongated light
reflectors having a cross section of a modified inverted U.

PRIOR ART

- 4 The following U.S. Patents are cited as prior art.
5 2,619,583 to BAUMGARTNER for LUMINAIRE FOR ELONGATED
6 LAMPS. This patent discloses a housing over the back of
7 the reflectors.
8 3,247,368 to McHUGH for FLUORESCENT LIGHTING FIXTURE.
9 This discloses the lights grouped under a hood and does
10 not include individual reflectors.
11 4,674,015 to SMITH for FLUORESCENT LIGHT FIXTURE WITH
12 REMOVABLE BALLAST. Disclosure is made of a plug in
13 ballast on the spine of the fixture.
14 4,814,954 to SPITZ for RIGID LIGHTWEIGHT FLUORESCENT
15 FIXTURE. Disclosure is made of a reflector positioned
16 between double walled end panels, which are connected
17 to one another by a double walled elongated box like
18 structure.
19 4,928,209 to RODIN for LIGHTING APPARATUS. This patent
20 discloses a reflector, having tube hangers one reflector
21 for each pair of tubes, and the reflectors mounted in a
22 cover.
23 5,062,030 to FIGUEROA for CUSTOMIZED LIGHT REFLECTOR.
24 This patent discloses reflectors mounted in existing
25 fixtures.
26 5,192,129 to FIGUEROA for CUSTOMIZED LIGHT REFLECTOR.
27 This patent discloses light reflecting planes installed
28 in a lighting fixture.

PAPER # 1

1 **0012-** DETAILED DESCRIPTION

2 The disclosure of this invention includes mounting of
3 a plurality of elongated fluorescent light tubes in a plurality
4 of elongated reflectors, and a ballast mounted in the assembled
5 elongated fluorescent light fixture.

6 **0013-** The invention described herein discloses a fluorescent
7 light fixture apparatus having downlight and suspended from
8 the ceiling; and each fluorescent tube light mounted in its
9 own reflector 4 for maximum "down light", and each reflector
10 4 attached to fluorescent light fixture frame 12. The
11 fluorescent light fixture apparatus may be for direct
12 downlight or semi-direct, in which case there may be slots in
13 the top surface of the reflectors. (see sec. 12, page 169
14 in "STANDARD HANDBOOK FOR MECHANICAL ENGINEERS" by BAUMEISTER
15 and MARKS (seventh edition)

16 **0014-** The fluorescent light fixture 1, top plan view Fig. 1
17 apparatus of this invention varies from the prior art, in
18 that in this invention, each fluorescent light tube 3, (Figs.
19 2, 5, 6 and 7) in the fixture assembly 1, (Figs. 6, 7) is
20 mounted in its own light reflector channel 4'' (Figs. 2, 3, &
21 6), on the concave side 4'' of the reflector 4 (Fig. 9).
22 The light reflectors 4, are attached to the socket mount/wire
23 raceway arms 6, by anchor rivets, bolts or screws 13, at each
24 end of the light reflector channels 4''. see Fig. 7. Fluores-
25 cent fixture tube shunted sockets 5 are mounted in aperture slots
26 17, for insertion and snap fit of fluorescent tube sockets 5
27 on the socket mount/wire raceway arms 6 (Figs. 3, 5, & 6) of
28 assembled fluorescent light fixture apparatus.

29 **0015-** Referring now to fluorescent light fixture frame 12

PAPER # 1

(Fig.8) showing a plan view of a figure H shape, with arms 6 extending outward and perpendicular to the ends of ballast channel assembly 2. and in each socket mount/wire raceway arm 6, apertures 17 for insertion of snap fit fluorescent fixture tube shunted sockets 5 and 5'. Ballast 23, for the fluorescent light tubes 3, is mounted in the ballast channel assembly 2 and electric power source 7 into light fixture apparatus 1, and a switch 20 for on/off of the power from the power line 7 to the ballast 23 in the ballast channel assembly 2.

0016- The ballast channel assembly 2, may be likened to a spine, attached to the socket mount/wire raceway arms 6.

0017- Fig. 7 is a perspective view of assembly components of the fluorescent light fixture of this invention, with the light reflectors 4, attached to the socket mount/wire raceway arms 6 by fasteners 19.

0018- Fig. 9 shows isolated light reflectors 4 and apertures 14 for fasteners to attach reflectors to socket mount arms 6.

0019- Fig. 13 shows reflectors having slots 18 in reflectors thus the "light" of the fixtures in addition to having the light go downward the light can also go upwards, but in a lesser amount.

0020- Fig. 14 is a cross-section view of a single fluorescent light fixture, and a single reflector 4, and ballast 23 mounted in ballast mounting channel assembly 22, and showing ballast channel bottom 22' and ballast channel cover 22'' fitting over the ballast channel bottom 22'.

0021- Fig. 15 is a perspective view of a single fluorescent

Page 10.

PAPER # 1

1 light fixture 21, and the ballast 23 mounted in ballast
2 channel assembly 2.

3 0022- Cross section view of socket mount/wire raceway arm 6
4 is shown in Fig. 12, and the arms 6 are assembled from bottom
5 section channel of socket mount/wire raceway 6' and top cover
6 channel section of socket mount/wire raceway 6'', fitting
7 together lengthwise and held in position by suitable screws
8 or rivets to provide the socket mount/wire raceway arm 6,
9 and wires 16, in arms 6 of fluorescent light fixture frame
10 12, (see Fig. 8) assembly.

11 0023- Referring now to Fig. 10, the wiring schematic is shown
12 and the ballast 23 is shown mounted in ballast channel
13 assembly 2, and as shown in Fig. 11, is an assembly of a
14 ballast channel bottom 2', and a ballast channel cover 2''
15 fitting lengthwise over ballast channel bottom 2' and this
16 assembly held together by conventional screws 15.

17 0024- The electric power source 7 into the light fixture
18 apparatus and on/off switch 20 connected to the power source
19 is shown in Figs. 1, 3.

20 0025- The Fluorescent light fixture 1, may hang from a ceiling
21 on hanger wire/chain 10 attached to hanger mounts 8, or to
22 screw mounts 9.

23 0026- Reference is now made to Fig. 8, fluorescent light fixture
24 frame 12 and the fluorescent light tube reflectors 4, are mounted
25 on the fixture frame 12, as shown in Fig. 7 perspective view of
26 fluorescent light fixture assembly, and the rim edges 11 on each
27 long edge of each reflector 4, and on assembly of the reflectors
28 4 on the light fixture frame 12, the rim edges 11 of the
29 reflectors 4 overlap as shown in Fig. 19 to give added
30 stability or rigidity to the assembled light fixture.

31 Reference is now made to Figs. 16, 17, and 18 showing cross
section of rim edges 11 of elongated reflector edge rims 11.

Page 11.

PAPER # 1

1 **0027-** The following is a description of the cross section
2 geometry of light reflectors 4, to insure maximum light
3 reflection downward from the fluorescent light tubes 3.
4 Referring to Fig. 16, wherein it is shown the fluorescent
5 tube 3, having a diameter D, then the radius R of the bend
6 of the reflector 4 is D X 0.875, and the arc at the bend of
7 the reflector is equal to 120°, and reflector sides are
8 tangent to the radius at the ends of the arc, and these
9 reflector sides extend outward to a dimension d' equal to
10 3.25 X D, between the edges of the reflector 4, and the
11 distance d between the fluorescent light tube 3 and the arc
12 of the bend of the light reflector is 0.375 X D. The
13 distance C is equal to 0.5 X D.

14 **0028** Reference is now made to Fig. 17, in which the cross
15 section of reflectors 4 is shown, and the parabola shape
16 compared to Fig. 16, is to reduce the dispersion of light
17 out of the sides of the fluorescent light fixture assembly
18 1. The reflectors 4 of Fig. 17 are described as the
19 fluorescent light tube 3, having a diameter D, then the
20 radius R' of the bend of the reflector 4 is D X 0.875, and
21 the arc at the bend of the reflector is equal to 160°, and
22 the sides of reflector 4, are tangent to the radius at the
23 ends of the arc, and these sides of reflectors 4 extend out-
24 ward to a dimension W equal to 2 X D, between edges of
25 reflector 4 sides. The distance d between the top of
26 fluorescent light tube 3, and the arc of the reflector is
27 equal to 0.375 X D.

28 **0029-** Note the height of the arc of reflector 4, as shown in
29 Figs. 16 and 17, is 1.8" which is approximate height to indi-
30 cate possible scale, and may be more or less as desired.

31

PLYMOUTH, WI 53073

REG. NO. 28,958

TEL - 920/892-8556
FAX - 920/892-2679

FILE # OR-1-02
DATE FEB 22 2002

Page 12.

PAPER 1

1

2 0030- The distance S, between the bottom of the fluorescent
3 light tube 3, and the line W between the edges of reflector
4, is equal to 0.25 X D.

5 0031- In all of the above description and formulas, the "X"
6 stands for "multiplication" or "times".

7 0032- Comparing Figs. 16 and 17, it is readily seen that
8 shortening "W" as shown in Fig. 17 then will focus light
9 downward with less light then extending out of the sides of
10 the fixture assembly 1, thus this invention discloses a
11 method to control light downward in a fluorescent light
12 fixture.

13 0033- The method of focusing downlight of a fluorescent
14 hanging light fixture 1 by reflectors 4 over each
15 fluorescent light tube 3, a reflector 4 extending the
16 length of the fluorescent light tube 4, and the cross
17 section of the reflector 4, is an arc straddling the
18 fluorescent light tube 3 and a space of 0.375 times diameter
19 of the fluorescent light tube 3 from the fluorescent light
20 tube 3 and the arc of the reflector 4 having a radius of
21 0.875 times the diameter of the fluorescent light tube 3
22 and the arc ranging from 120° to 160° and the sides of
23 the reflector 4, tangent at each end of arc range of
24 reflector 4.

25 0034- The reflector 4, of this invention may be of
26 polished sheet metal or metal coated plastic, or metal
27 coated glass.

PAPER # 1

1
2

3 **0035** To further describe the elongated reflectors 4 of this
4 invention, in cross section the shape is a modified inverted
5 U, and the two edges of the elongated reflectors are bent
6 outwards to form rim edges 11, on the length of each edge see
7 Figs. 16,17 and 18. The rim edges 11 overlap as shown in
8 Fig. 19 on assembly of the fluorescent light fixture.

9 **0036** The specification and drawings disclose a fixture
10 apparatus having six elongated reflectors, and six elongated
11 fluorescent light tubes but this invention is not limited to
12 that number, and includes any number of elongated reflectors and
13 elongated fluorescent light tubes of from two to a total of
14 eight reflectors and eight fluorescent light tubes and one
15 ballast in the assembly.

16 **0037** Reference is made to Fig. 4, front elevational view of
17 assembled fluorescent light fixture, and Fig. 10 is a plan view
18 of the light fixture and schematic of the wiring from the
19 ballast 23 to the fluorescent light sockets with the single wire
20 Red from the ballast to the sockets 5' connected in series, and
21 a single Blue wire from the ballast 23 to each of the sockets 5.
